OC COMMAND CENTRE v4.0.3

Newsletter settings import: compliance check

Eaglewing [571041] · October 2026 · Source: github.com/Eaglewing91/OC-Command-Centre (functions `fillNewsletter`, `readNewsletter`, `checkNewsletter`, `decodeRules`, `cleanRules`)

Result: compliant. No rule breaks and no concern flags. The feature makes no network requests of any kind, reads only the faction newsletter the member has opened themselves, and keeps all data on the member's device.

1. Purpose

Faction leaders share their OC CPR requirements with every member through a normal faction newsletter. Members with the script get the rules automatically when they open that newsletter, instead of copying and pasting a code by hand.

2. How it works: leader side

1. In CPR settings the leader chooses **Generate settings code**. The rules are serialised to JSON, compressed (deflate-raw), base64url-encoded and given an FNV checksum: `OCC1.z.<data>.<checksum>`.
2. The code holds only OC names, role minimum/maximum CPR, hidden and start-last flags, the joining-policy numbers and a timestamp. It contains no player names, IDs, API keys or API data.
3. `fillNewsletter()` writes a subject and body into the script's **own** text boxes for the leader to copy. It does not touch Torn's compose form and sends nothing.
4. The leader pastes the text and sends the faction newsletter manually through Torn.

3. How it works: member side

1. **Page gate.** The feature only runs when `location.pathname === '/messages.php'`, a page the member has loaded themselves.
2. **Waiting for the mail.** Torn renders an opened mail after page load. A `MutationObserver` on the page calls `checkNewsletter()` at most once per animation frame, and a `hashchange` listener does the same when the member clicks to another mail. Both only **read** the DOM already on screen.
3. **Reading one mail.** `readNewsletter()` looks only at the mail on screen (`.reply-mail-container > .editor-content`). Its first element must be Torn's own bold `<p>` reading "This is a newsletter from your faction:". Player-written text sits inside the following `<div>`, so an ordinary mail cannot fake this line. If it is missing, the function stops.
4. **Finding the code.** A regex matches an `OCC1` code in that `<div>`'s text. The sender's name and player ID are read from the profile link already on the page.
5. **Local validation.** `decodeRules()` checks the format, decompresses, verifies the checksum and parses the JSON. `cleanRules()` limits every value (CPR 0 to 100, at most 200 OCs and 20 roles each, capped string lengths). A damaged or edited code is rejected.
6. **Applying.** Rules are applied only if newer than the member's current ones (by timestamp); the same or older codes are ignored. The previous rules are saved for Undo, the new rules and the sender's name/ID are saved to GM storage, and the crimes-page display is redrawn.
7. **Notice.** The member sees a "What changed" list and an **Undo** button. All mail-derived text is inserted with `textContent` or escaped, so mail content can never run as code.

What it never does: no fetch, XHR, GM request or WebSocket anywhere in this feature; no opening, loading or scanning of the inbox or other mails; no clicks, form submissions or page actions. It is the automatic equivalent of the member copying the code from the screen and pasting it into the script's Import box, which is also available.

4. Torn scripting rules

"The use of scripts... is allowed only if it uses data from our API or a page you have loaded manually and are currently viewing. They cannot make additional non-API requests to Torn, scrape pages that you're not currently viewing, or attempt to bypass the captcha. If the software... makes non-API requests that are not manually triggered by you, it is not allowed."

Requirement	Result
Uses only the API or the page being viewed	**PASS** Reads only the newsletter open on messages.php. No API is used.
No additional non-API requests to Torn	**PASS** None. The feature contains no network calls.
No scraping of pages not being viewed	**PASS** Never loads the inbox, other mails or other pages.
No captcha bypass	**PASS** Not applicable.
Non-API requests only when manually triggered	**PASS** No requests are made, so there is nothing to trigger.

5. Additional review parameters

Parameter	Result
One user input = one network request or page event	**PASS** The import causes no network request or page event at all.
No automatic events or requests from an observer, loop or timer	**PASS** The MutationObserver only reads the page and saves locally. It never clicks, submits or requests.
Display-only changes (highlighting, sorting, disabling UI) allowed if no request results	**PASS** Imported rules only change colours, labels, ordering and greyed-out Join buttons. A blocked Join ignores the member's own click, so no request is sent.
Flag: data sent to or received from external sites	**PASS** None in this feature.
Flag: WebSocket connections	**PASS** None.
Flag: malicious code or injected instructions	**PASS** None. Mail text is only regex-matched, never executed; decoded rules are limited to fixed fields and ranges.

6. Terms of Service (this feature)

Data Storage	Only locally: the CPR rules, the sender's name and player ID (for the "imported from..." line) and an Undo copy, in the userscript manager.
Data Sharing	Nobody.
Purpose of Use	Public community tools: sharing faction CPR rules with members.
Key Storage & Sharing	Not stored / Not shared. This feature uses no API key.
Key Access Level	None required. Regular members do not need a key.

7. Notes

- **Trust:** anyone in the faction with permission to send newsletters can push rules. This is not a rules issue; members can Undo, and the change only affects their own display.
- **Documentation:** the README, forum post, guide and script header now state that the sender's name and player ID are kept locally (corrected in this release).
- **Related but separate:** the leader dashboard's Mail button is a plain link that opens Torn's compose page when the leader clicks it. It is user-initiated navigation and is not part of this feature.
