OC

OC Command Centre

User guide · version 4.0.1

A Tampermonkey / Torn PDA userscript for Torn organized crimes: CPR rules on the crimes page for every member, and a live command centre, reports and alerts for faction leaders.

Created by Eaglewing [571041]

Screenshots were taken in a test environment with sample data and fictional member names.

Contents

#	Section	Covers
1	Overview	What the script is and who it is for
2	Who sees what	Members, leaders and the API key
3	The crimes page	Colours, status bar, Join blocking and reasons
4	The member menu	Importing rules and display options
5	Sharing CPR rules	Settings codes, faction newsletters and "What changed"
6	CPR settings (leaders)	Requirements, hidden crimes and the joining policy
7	Live overview (leaders)	Free members, crimes, issues and estimated success
8	Reports (leaders)	Overview, participation, item costs and activity log
9	OC BREACH alerts (leaders)	Background checks and alert types
10	Dashboard settings	Every option explained
11	Where it runs and Torn PDA	Pages, devices and outside services
12	Torn rules and Terms of Service	Compliance summary and ToS table
13	Credits	

INTRODUCTION

1. Overview

OC Command Centre helps a Torn faction run organized crimes (OC 2.0). It does two jobs in one script:

- **For every member**: on the faction crimes page it colours each role against your faction's CPR requirements, shows a status bar on each OC, and greys out Join buttons a member should not use, with the reason underneath.
- **For faction leaders** (members whose position has Faction API access): a full dashboard with a live overview, reports, item costs, OC BREACH alerts and the CPR rules editor.

No faction's rules are built in. Leaders set their own CPR requirements and send them to members as a **settings code**, usually in a **faction newsletter**, which members' scripts import automatically when the newsletter is opened.

At a glance

Feature	Members	Leaders
CPR colours, weights and status bar on the crimes page	Yes	Yes
Join-button blocking with reasons	Yes (can be turned off)	Yes
Automatic rule import from faction newsletters	Yes	Yes
API key needed	No	Yes (Minimal, with Faction API access)
Live overview, reports, item costs, CSV exports	–	Yes
CPR rules editor and settings codes	–	Yes
OC BREACH alerts	–	Yes

Safe by design. The script never clicks, joins, leaves or submits anything for you. It only reads the page you are viewing and the Torn API, and every action that reaches Torn is one you make yourself.

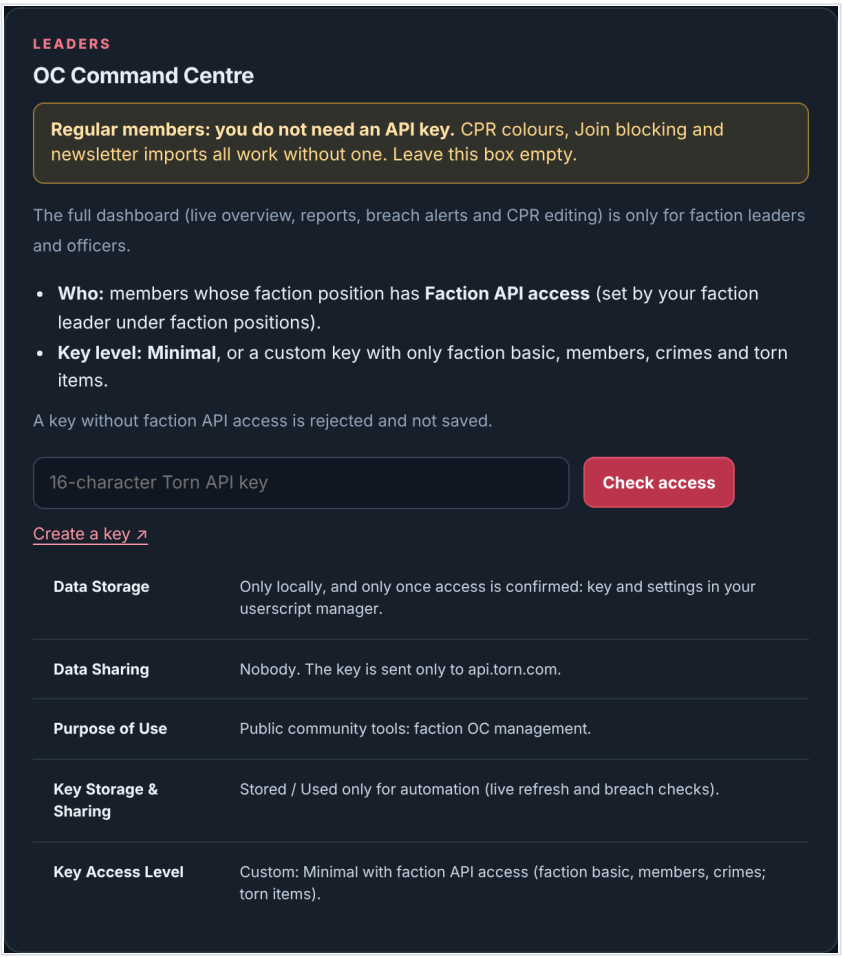

ACCESS

2. Who sees what

Everyone with the script gets the crimes-page helpers. The leader dashboard only unlocks for a key that can read the faction's organized crimes, which Torn only allows for positions with **Faction API access**.

	Regular member	Leader / officer
Opens	The **member menu** ("OC CPR requirements")	The **OC Command Centre dashboard**
How to open	Tampermonkey menu → "OC Command Centre / CPR settings", or the **Open** button on the crimes-page summary card	The same, plus the optional floating launcher button and the OC BREACH "View" button
API key	Not needed	Minimal key, or a custom key with only faction basic, members, crimes and torn items, from a position with Faction API access

Why Minimal? The only selection that needs more than a Public key is **faction crimes**. Torn only returns it to a Minimal-or-higher key whose owner has Faction API access, which is also how the script checks access. A key without that access is rejected and never saved. If a leader later loses the position, the next API call fails, the dashboard locks and the key is deleted from their device.

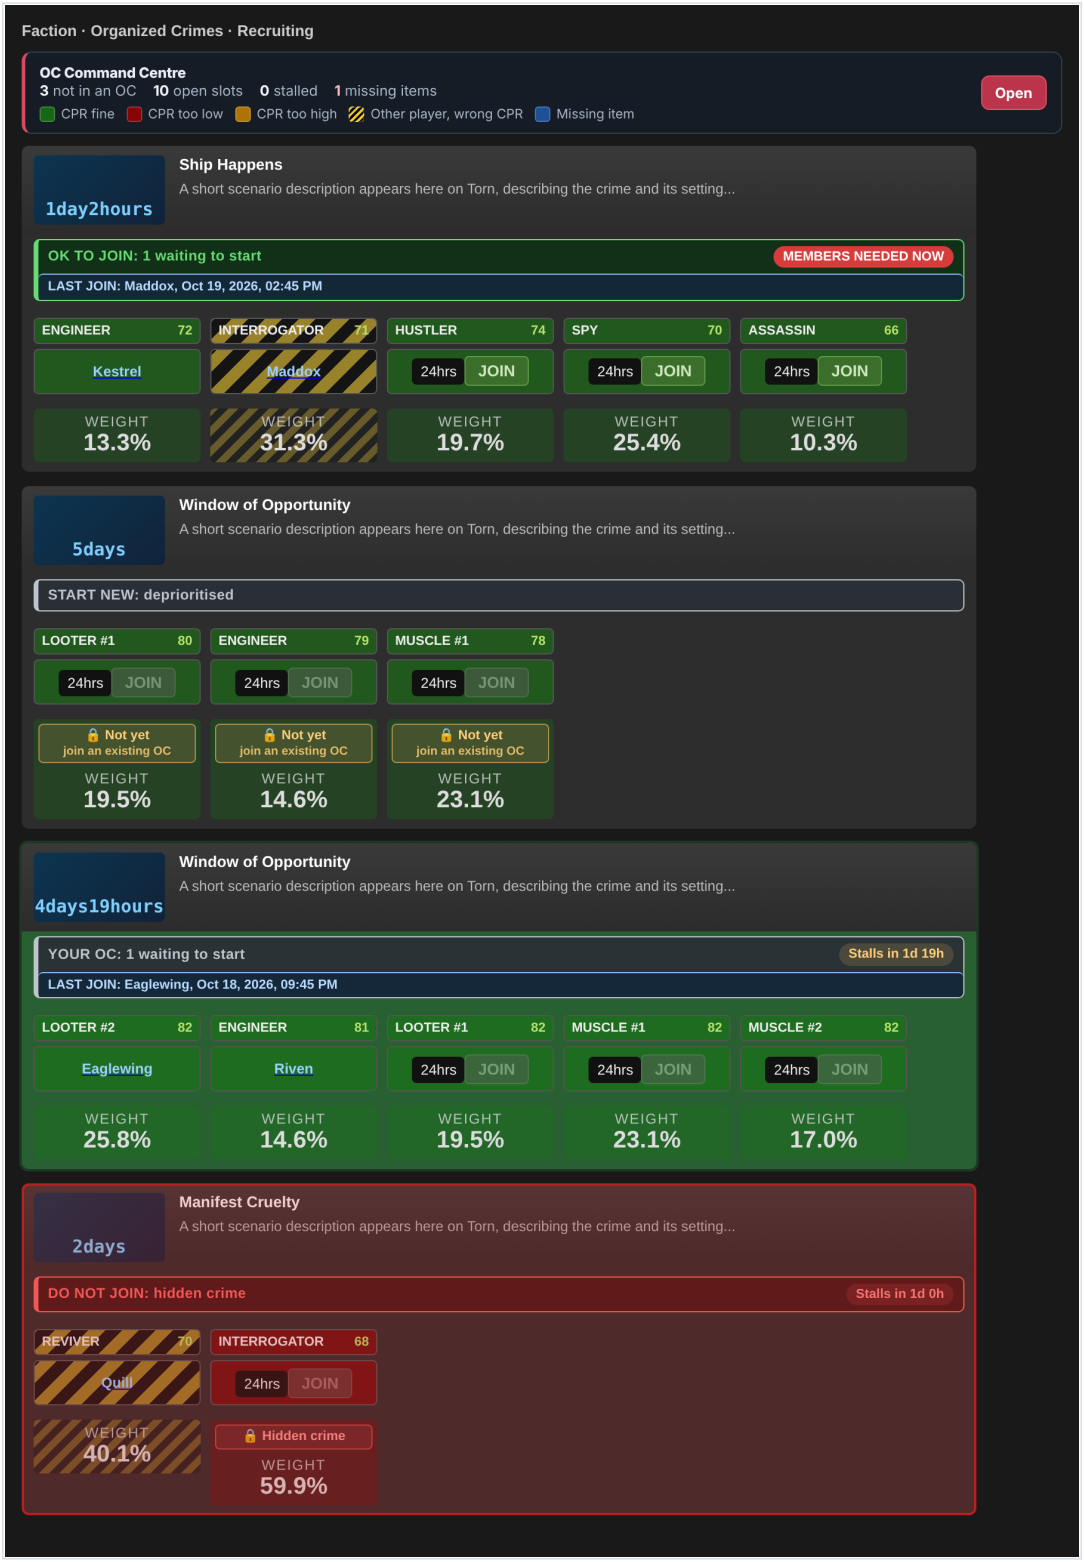

The Leaders section of the member menu: regular members are told clearly they do not need a key; leaders see who qualifies, the key level, and the Terms of Service.

EVERY MEMBER

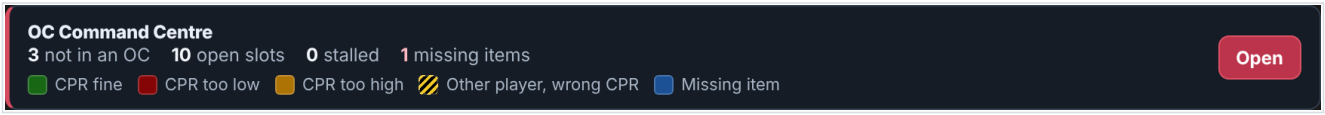

3. The crimes page

On the faction **Crimes** tab (and organizedcrimes.php) the script decorates each OC card. Nothing is clicked or sent: it only changes what you see.

The crimes page with the script running (sample data). From the top: summary card, an OC that is OK to join, a new OC to start last, your own OC, and a hidden crime someone joined anyway.

Summary card

The summary card above the crimes list: free members, open slots, stalled OCs, missing items, a colour legend and an Open button.

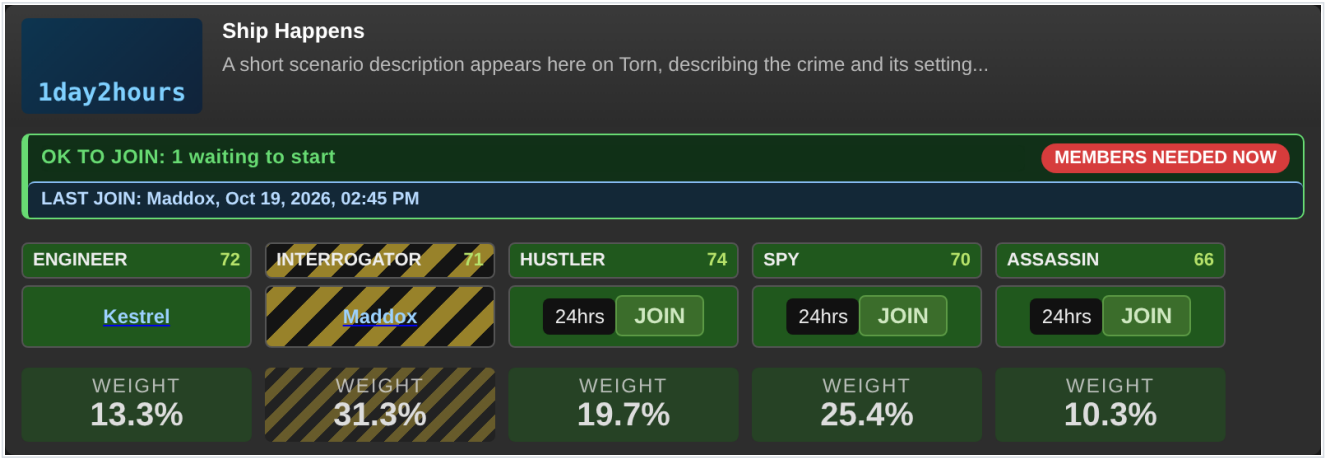

Role colours

Colour	Meaning
Green	Your CPR meets this role's requirement (or a member in the slot meets it).
Red	Your CPR is below the minimum.
Orange	Your CPR is above the role's maximum (used to keep strong members off easy roles).
Yellow / black stripes	Another member is in this slot with the wrong CPR.
Blue	The member in this slot is missing the required item.
Bright green card	An OC you are in.
Red overlay	A hidden crime (nobody should join) that someone has joined.

Each role also shows its **weight** (how much it matters to the crime's success), from Torn Probability.

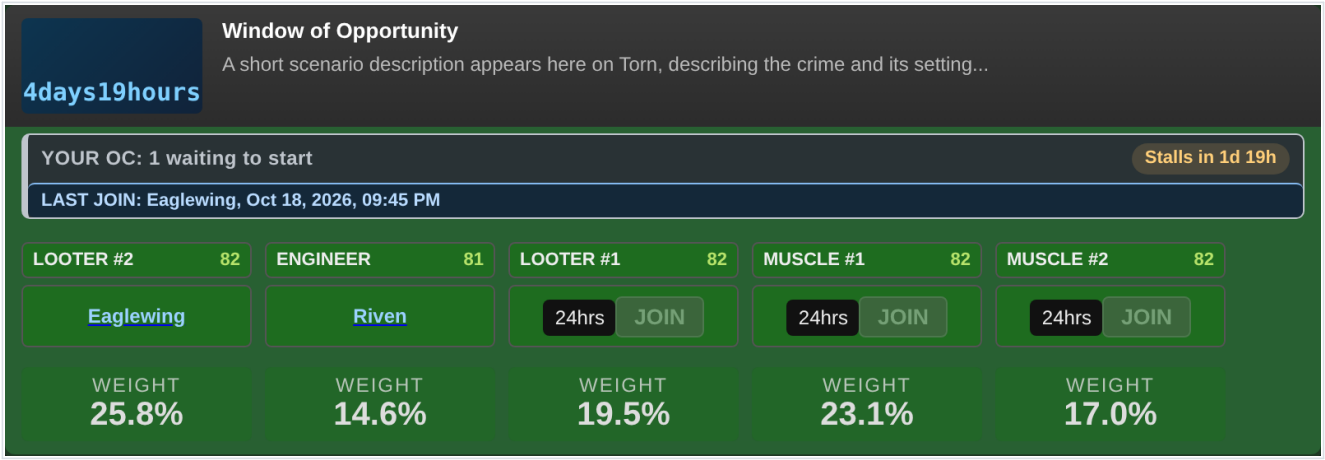

The status bar

Each OC gets one status bar under its title. The left side is the join status and sets the bar's colour; the right side holds the stall timer; a slimmer line below shows LAST JOIN or JOINED TOO EARLY.

OK TO JOIN (green), a red MEMBERS NEEDED NOW timer, LAST JOIN, and a greyed-out Spy role with its reason: Needs 73, you have 70.

Part	What it shows
Join status (left)	OK TO JOIN · WAIT · START NEW · YOUR OC · DO NOT JOIN: hidden crime · STALLED: JOIN NOW · EXCEPTION ROLE AVAILABLE · FALLBACK JOIN THIS OC. Joining-policy statuses only appear if your faction uses a joining policy.
Stall timer (right)	"Stalls in 3h 20m" or "Stalls in 2d 4h": how long until the OC stalls if its open roles are not filled. Grey normally, amber under 48h, red under 24h, solid red **MEMBERS NEEDED NOW** when it is already stalled or about to.
Lower line	**LAST JOIN** (blue): who joined most recently and when (leaders, from the API). **JOINED TOO EARLY / POSSIBLE EARLY JOIN** (red): someone joined while the joining policy said wait.

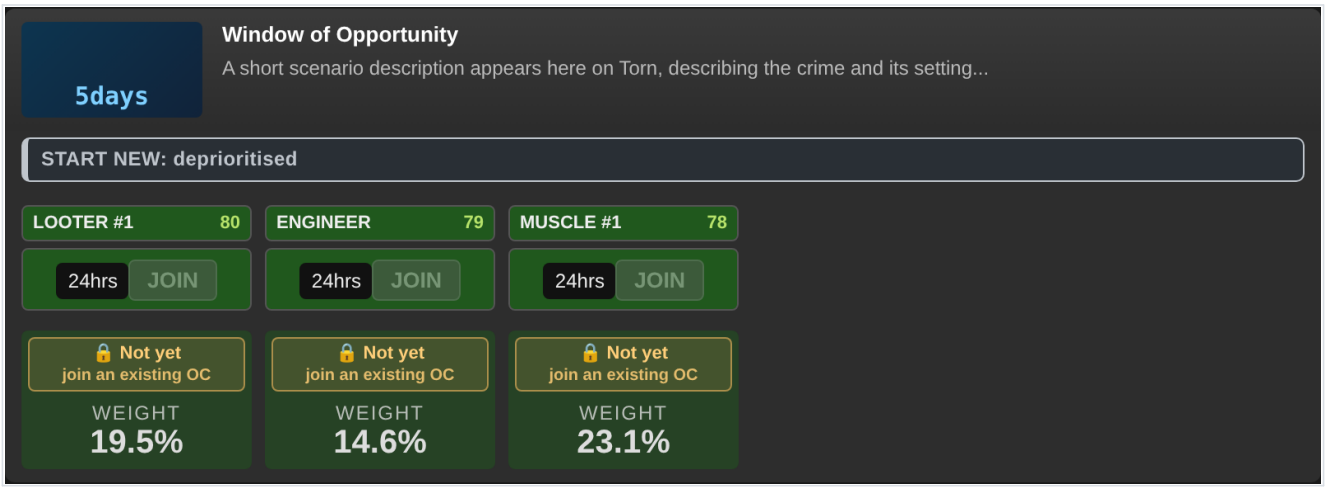

Your own OC: YOUR OC status and an amber stall timer. The other Join buttons are greyed out (you cannot take two roles) without a label, as the status bar already says why.

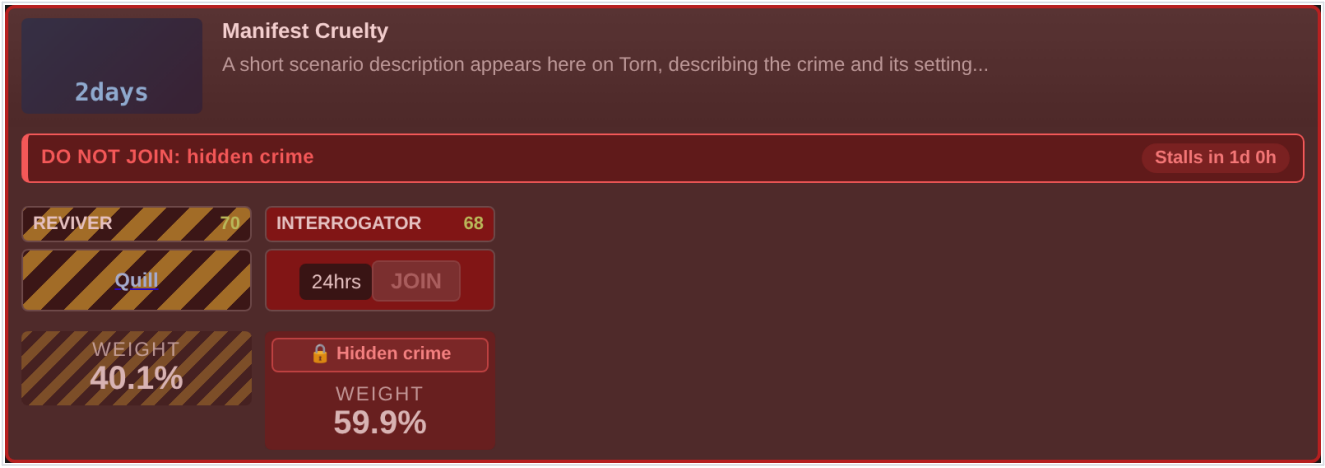

Why a Join button is greyed out

When blocking is on (the default), a short reason appears under each greyed-out Join button. Clicking a greyed-out button does nothing: the script stops your own click before Torn sees it, so no request is ever made.

Reason shown	When
Needs 73 / you have 70	Your CPR is below the role's minimum.
Max 80 / you have 85	Your CPR is above the role's maximum.
Hidden crime	Your faction has marked this OC as one nobody should join.
Wait / 2 not planning	Joining policy: too many members in this OC have not started planning.
Not yet / join an existing OC	Joining policy: an existing OC still has a role you qualify for, so do not start a new one.

A new, empty OC set to be started last: START NEW: deprioritised, with "Not yet" on each role because an existing OC can still be joined.

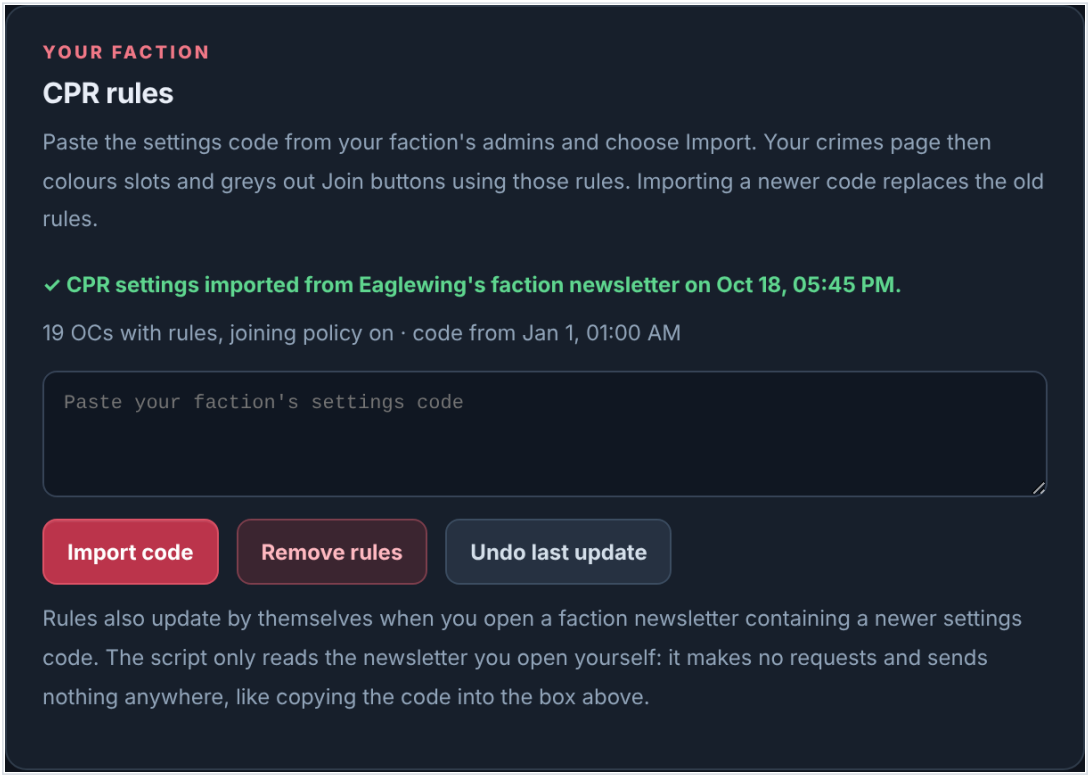

A hidden crime that someone joined: red overlay, DO NOT JOIN status and a "Hidden crime" reason. While a hidden crime is empty it is removed from the list entirely.

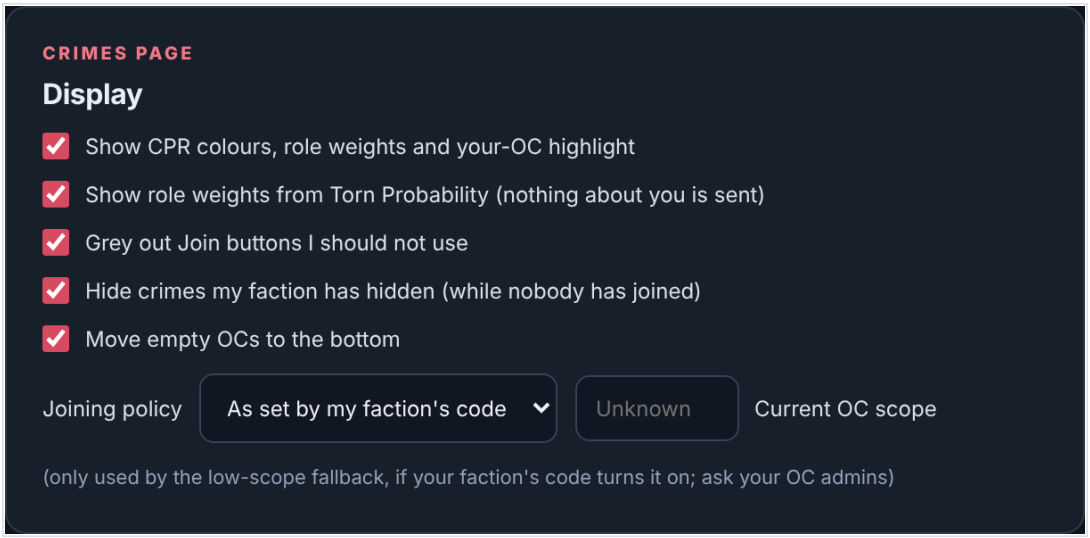

EVERY MEMBER

4. The member menu

Members without dashboard access open the member menu ("OC CPR requirements"). It has three sections.

CPR rules: a green line confirms the rules were imported, who sent them and when, plus a summary. Paste a code and choose Import code for a manual import; Undo last update restores the previous rules.

Display: switch the crimes-page helpers on or off, choose whether to follow the faction's joining policy, and enter the current OC scope (only used by the low-scope fallback).

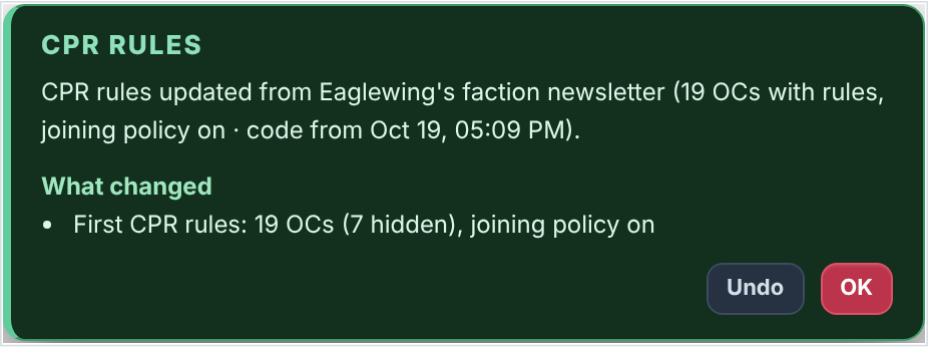

The third section, **Leaders**, holds the API key box shown in section 2. Regular members can leave it empty.

5. Sharing CPR rules

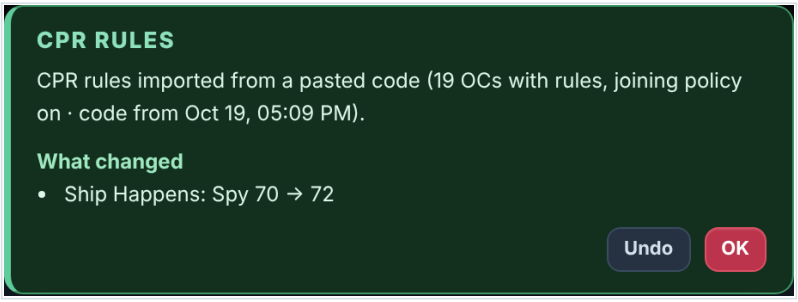

Leaders set the rules once in CPR settings and share them as a **settings code**: a single line of text such as `OCC1.z.hVXL...2250d65f`. It holds every OC's requirements, hidden crimes and joining-policy settings, with a built-in checksum so a damaged code is rejected rather than imported wrongly.

Faction newsletters (automatic)

- Generate a code in CPR settings. The script also writes a ready-to-send newsletter (subject and message) that you can copy.
- Send it as a **faction newsletter**. The subject can be anything; the code can be anywhere in the text, even wrapped over several lines.
- When a member opens the newsletter, their script reads the code from the page they are viewing and imports it straight away if it is newer than their current rules. No request is made.
- Only real faction newsletters are trusted: the script checks for Torn's own "This is a newsletter from your faction:" line, which cannot be typed into an ordinary mail.

The notice a member sees when a newsletter updates their rules. "What changed" lists the differences; for a first import it summarises the rules. Undo restores the previous rules.

A later import showing a single change: Ship Happens Spy minimum 70 → 73.

> Changes are listed per OC, for example "Blast from the Past: now hidden", "Window of Opportunity: no longer started last" or "Joining policy wait limit 1 → 2". Up to 12 changes are shown, then "and N more".

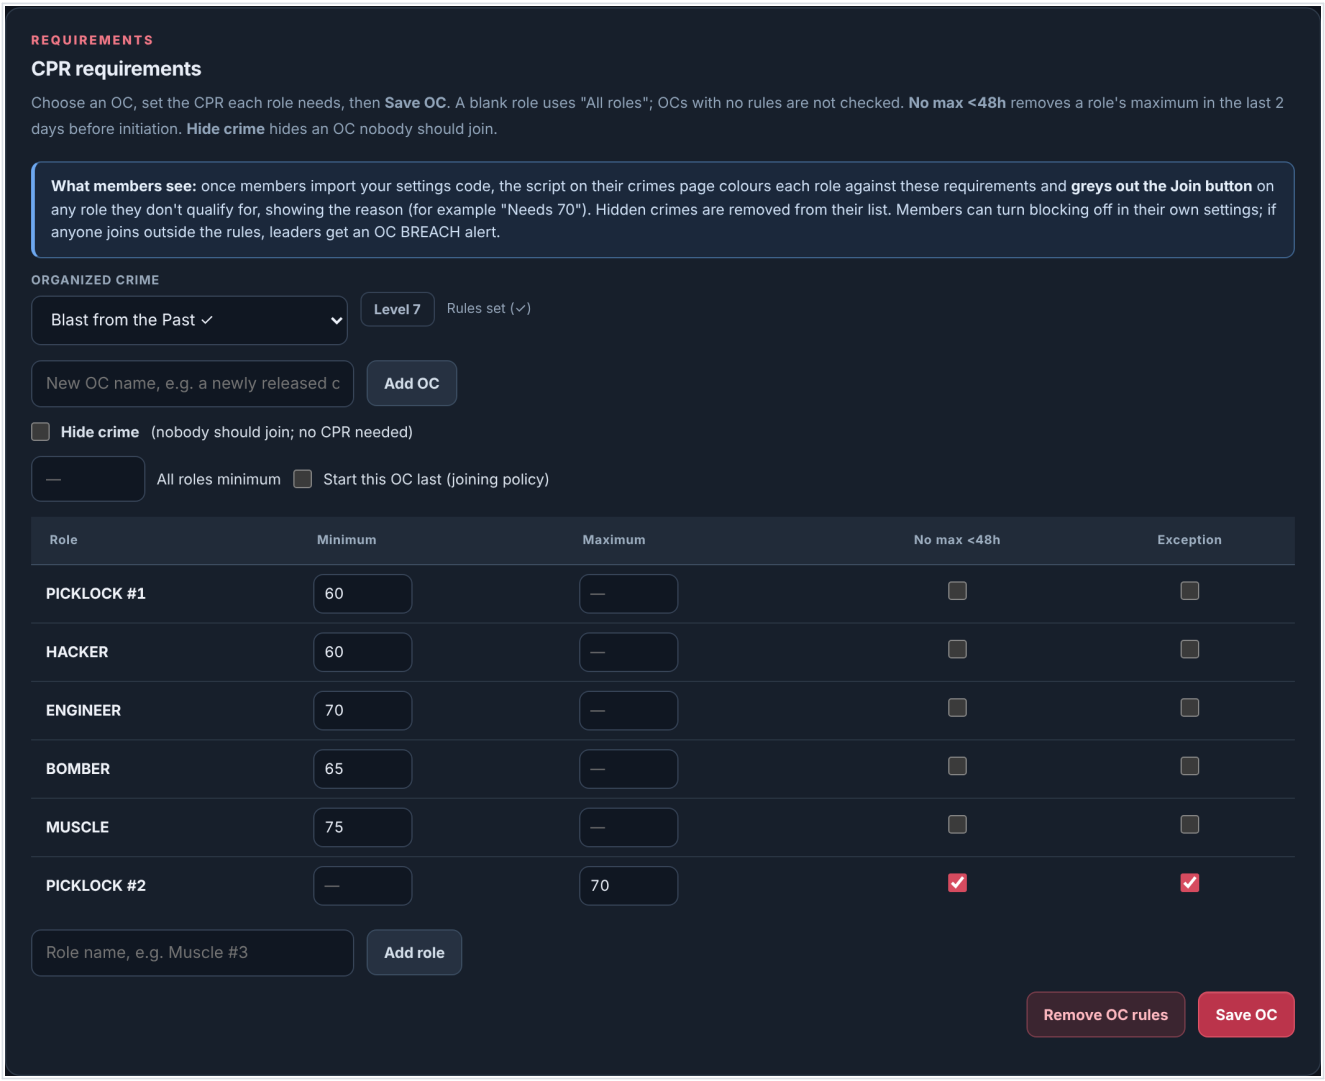

Is the newsletter auto-import allowed?

Yes. It only reads a faction newsletter **you open yourself**, using the page you are currently viewing, which Torn's scripting rules allow. It is the automatic version of copy and paste, with no extra requests.

Concern	What actually happens
Does it read my mail?	Only the one faction newsletter you open. It never opens, fetches or scans your mailbox or any other mail.
Does it make requests?	No. No API call and no page request to Torn or anywhere else. It copies the code from the text already on your screen.
Does anything leave my device?	No. Only the settings code is used, plus the sender's name and player ID for the "imported from..." line, kept locally; the rest of the mail and your other messages are never stored or sent. The rules are saved in your userscript manager.
Does it act on Torn?	No. Imported rules only change how the crimes page looks for you. It never clicks, joins or submits anything.
Can someone fake it?	Only genuine faction newsletters are trusted: Torn's own "This is a newsletter from your faction:" line is required, and it cannot be typed into an ordinary mail.
Can I reverse it?	Yes. Every import shows "What changed" with Undo, and rules can be removed at any time in the member menu.

RULES EDITOR

6. CPR settings (leaders)

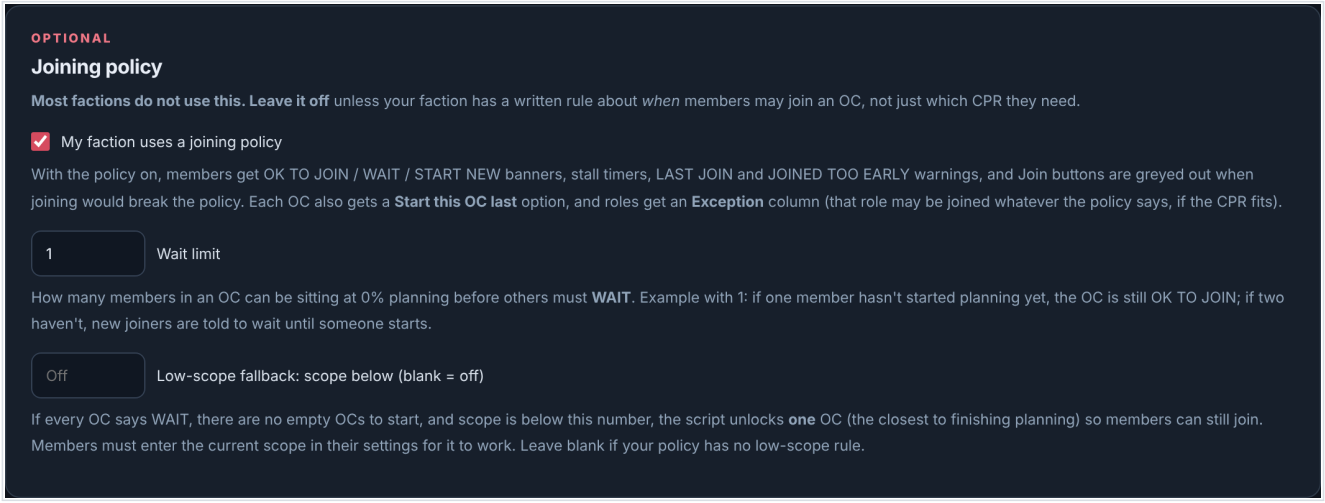

The CPR requirements editor with Blast from the Past selected, the "What members see" box, and per-role minimums and maximums.

Control	What it does
Organized crime	Choose an OC; the list is grouped by level, and ✓ marks OCs with rules. **Add OC** adds a newly released crime by name.
Hide crime	Nobody should join this OC. Members do not see it while it is empty; if someone joins anyway it shows with a red overlay, Join is blocked and leaders get an OC BREACH alert.
All roles minimum	Used for any role left blank.
Minimum / Maximum	Per-role CPR limits. A maximum keeps strong members off roles that need less.
No max <48h	Removes the role's maximum in the last 2 days before initiation, so anyone can fill it late.
Add role	Adds a role the script has not seen yet, e.g. "Muscle #3".
Save OC / Remove OC rules	Saves or clears this OC. OCs with no rules are not checked.

Joining policy (optional)

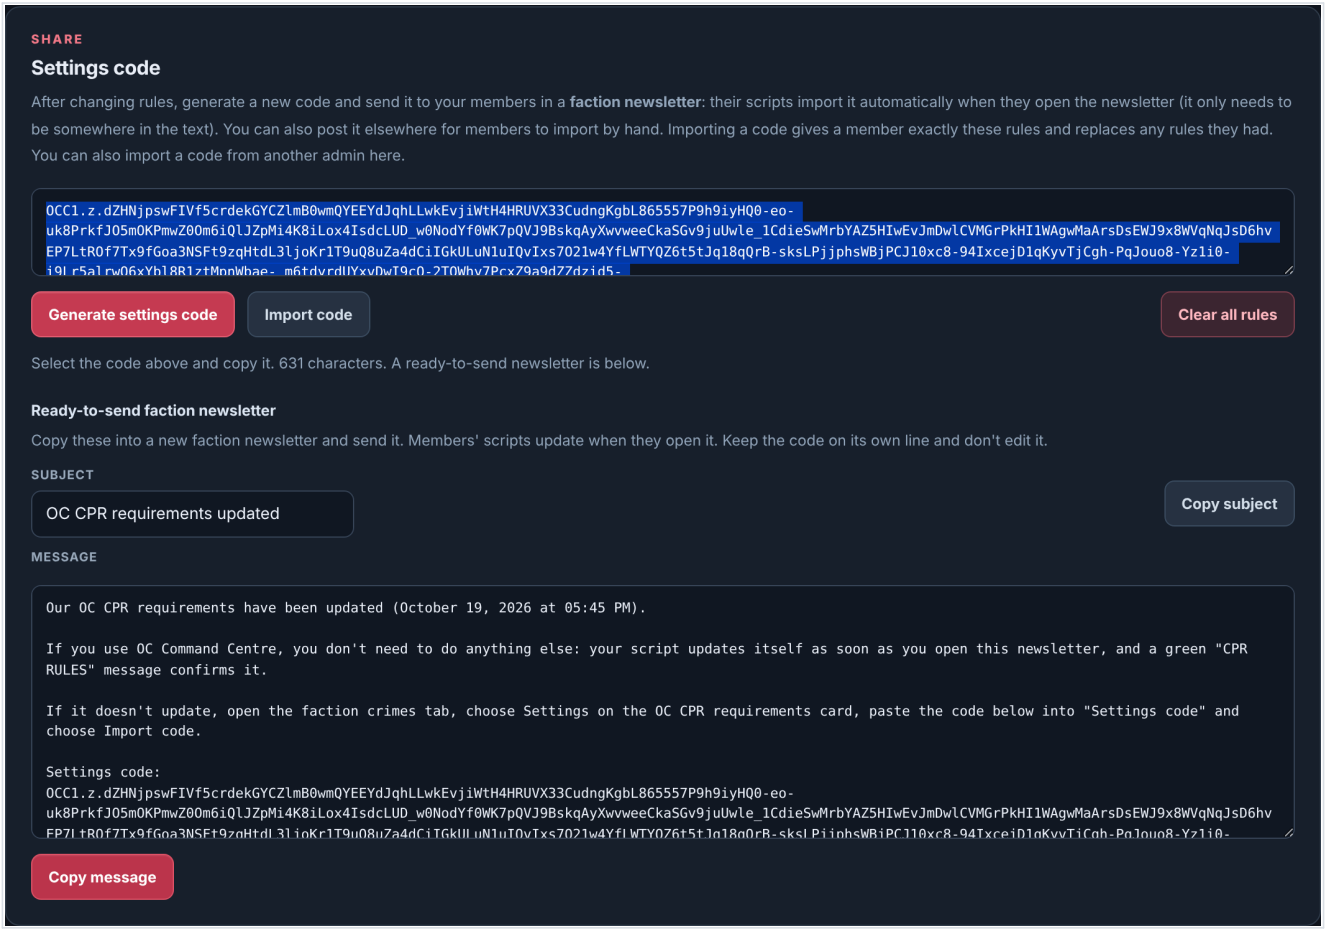

Most factions do not use this, and it is **off by default**. Turn it on only if your faction has a written rule about *when* members may join, not just which CPR they need. While it is off, "Start this OC last" and the Exception column are hidden.

The Joining policy section with the policy on.

Setting	Meaning
Wait limit	How many members in an OC can be at 0% planning before others must WAIT. With 1: one member not yet planning is fine; two means new joiners wait.
Low-scope fallback	If every OC says WAIT, there are no empty OCs to start, and scope is below this number, the script unlocks one OC (the closest to finishing planning). Members must enter the current scope in their settings. Leave blank if your policy has no low-scope rule.
Start this OC last	Per OC: list it last when starting new OCs (e.g. Window of Opportunity).
Exception	Per role: members may join it whatever the policy says, if their CPR fits (e.g. Picklock #2, Driver).

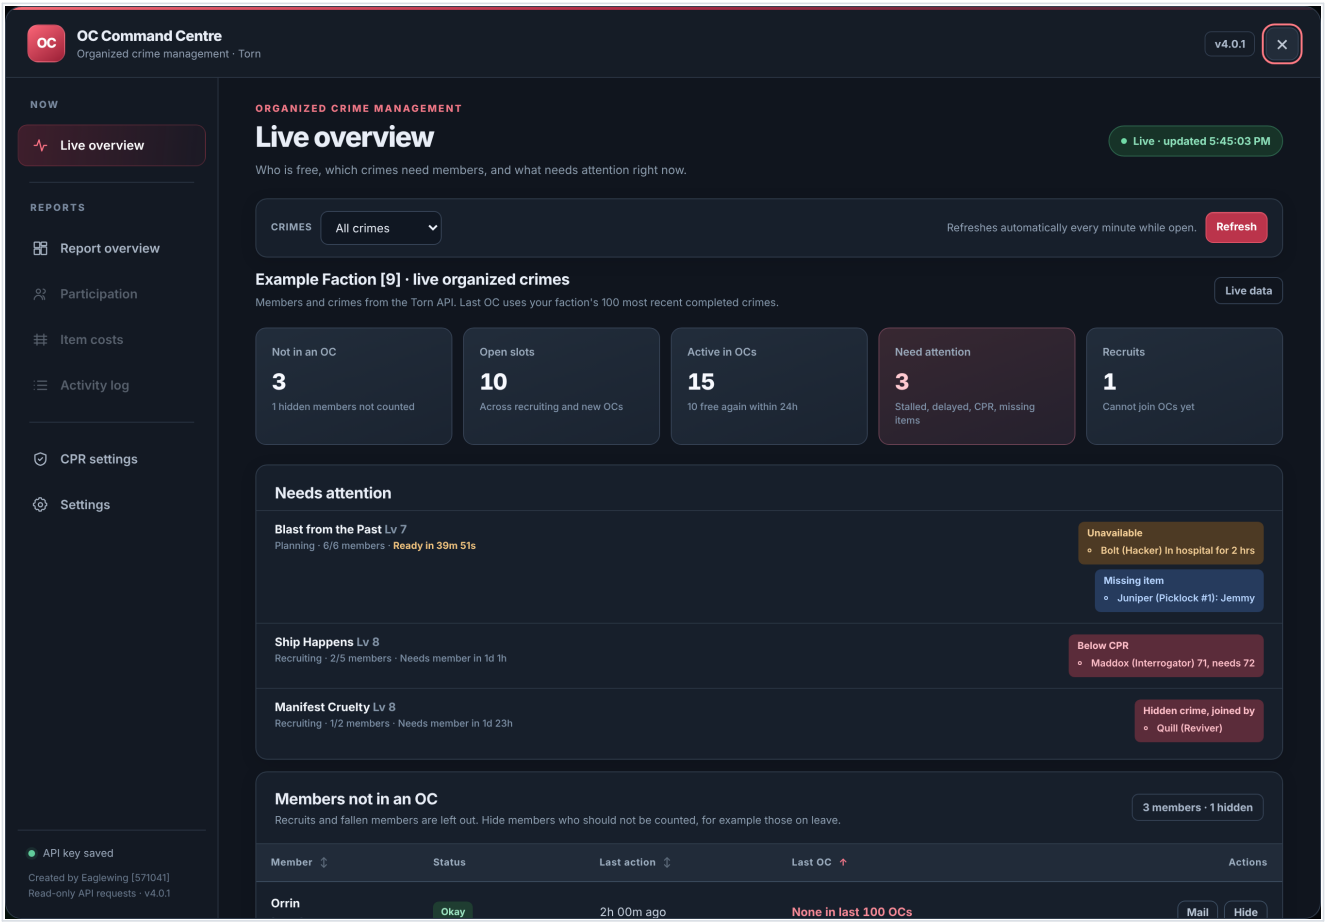

Settings code and newsletter template

After Generate settings code: the code is copied, and a ready-to-send newsletter subject and message are filled in below it. Import code lets an admin load a code from another admin.

DASHBOARD

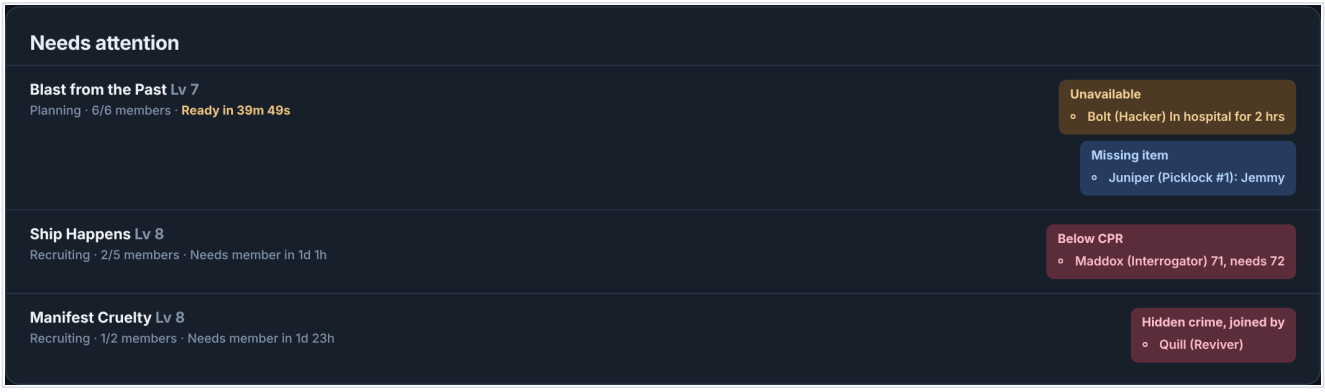

7. Live overview (leaders)

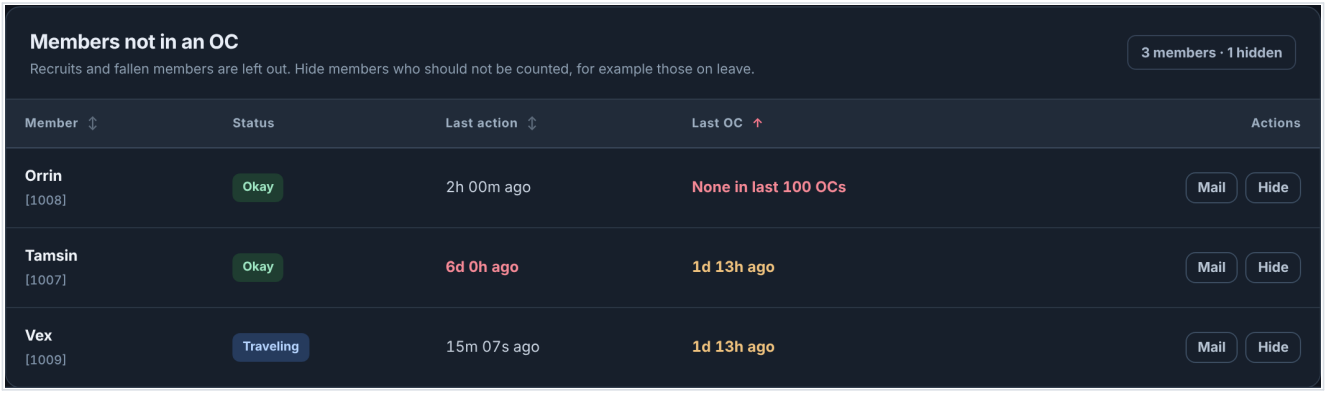

The dashboard opened on Live overview. It refreshes from the Torn API at most once a minute while open.

Headline cards: members not in an OC, open slots, active members (and how many free up within 24h), crimes needing attention, and recruits.

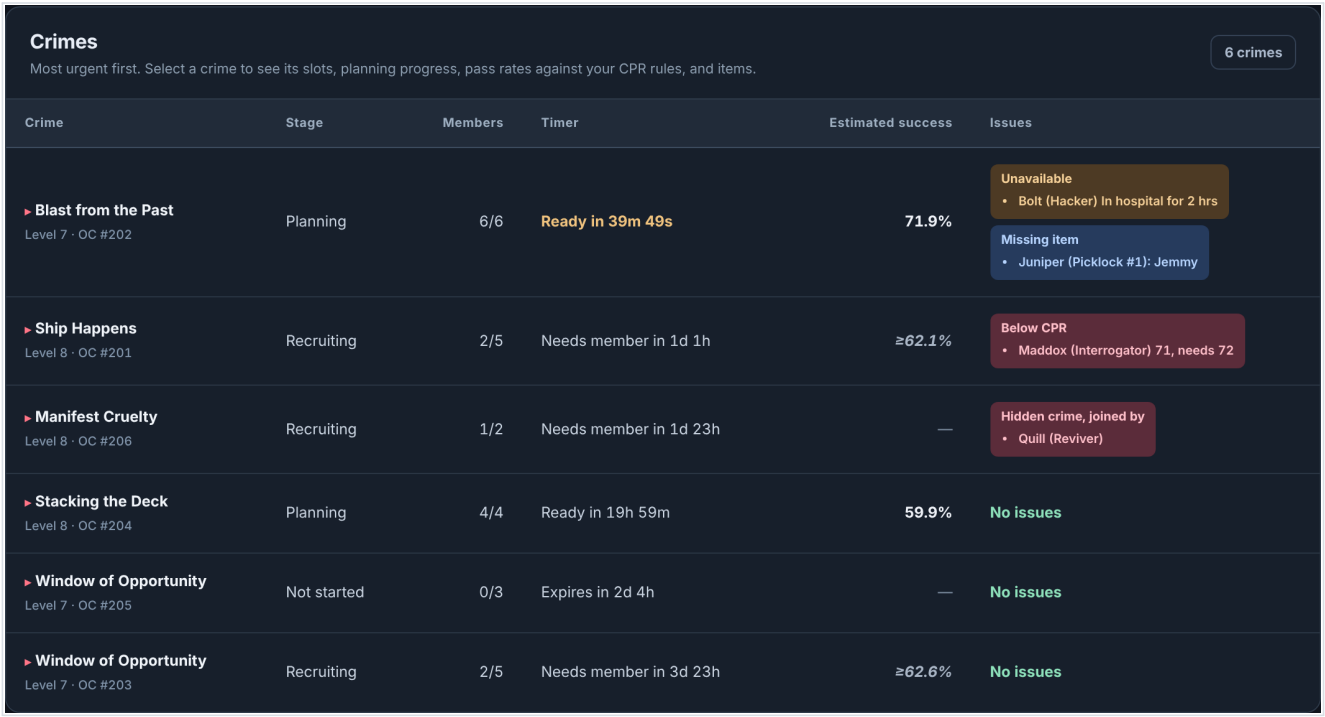

Needs attention: every crime with a problem — below or above CPR, hidden crime joined, missing items, members unavailable close to the start, stalled or delayed crimes.

Members not in an OC: status, last action and their last completed OC (amber / red past your thresholds). Mail opens a Torn mail to that member; Hide leaves someone out, e.g. while on leave.

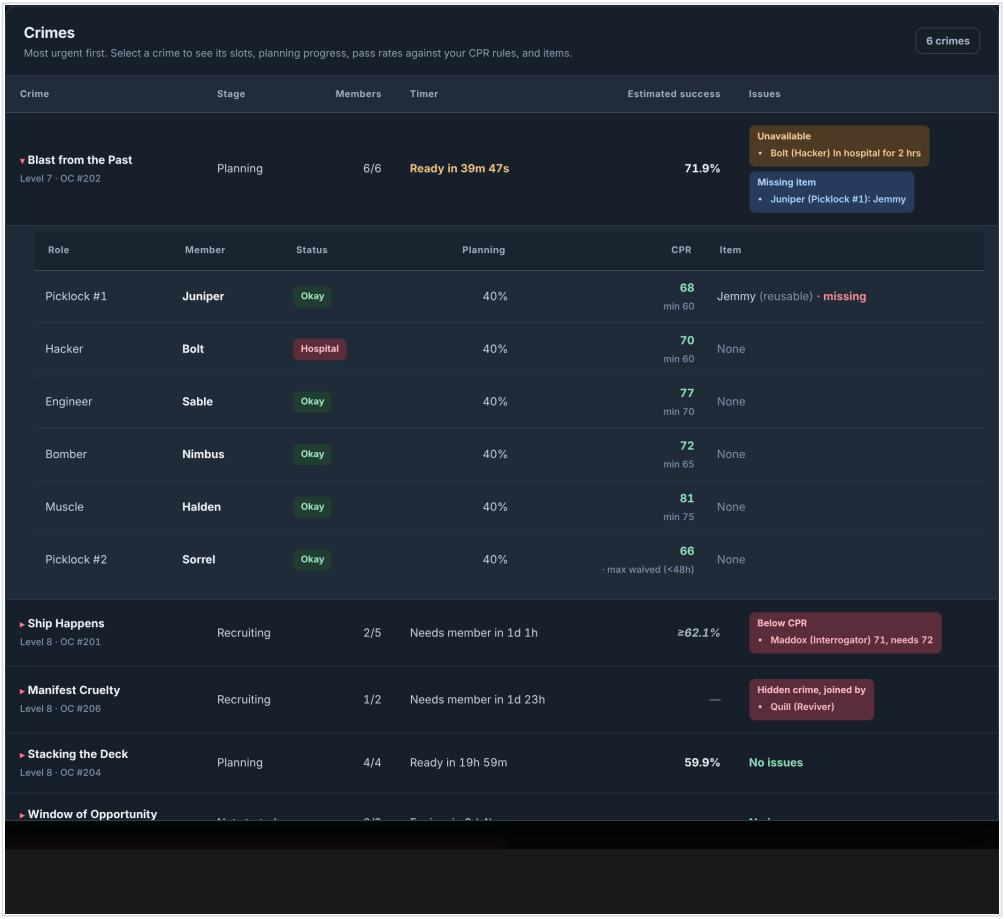

> Hidden members are listed in **Settings → Hidden members**, where **Show again** brings them back. The live overview also shows how many are hidden.

Crimes, most urgent first: stage, members, timer, Estimated success and issues.

Estimated success	Meaning
71.9%	A full crime: Torn Probability's estimate from the members' real pass rates.
≥67.9%	A recruiting crime (projection): members already in it use their real rates, and open roles are counted at your faction's minimum CPR. Stronger joiners would raise it.
—	Cannot be estimated (e.g. a role with no minimum, or a crime Torn Probability does not support). Hover for the reason.

Estimated success is optional (Settings) and is an estimate, not Torn's own figure.

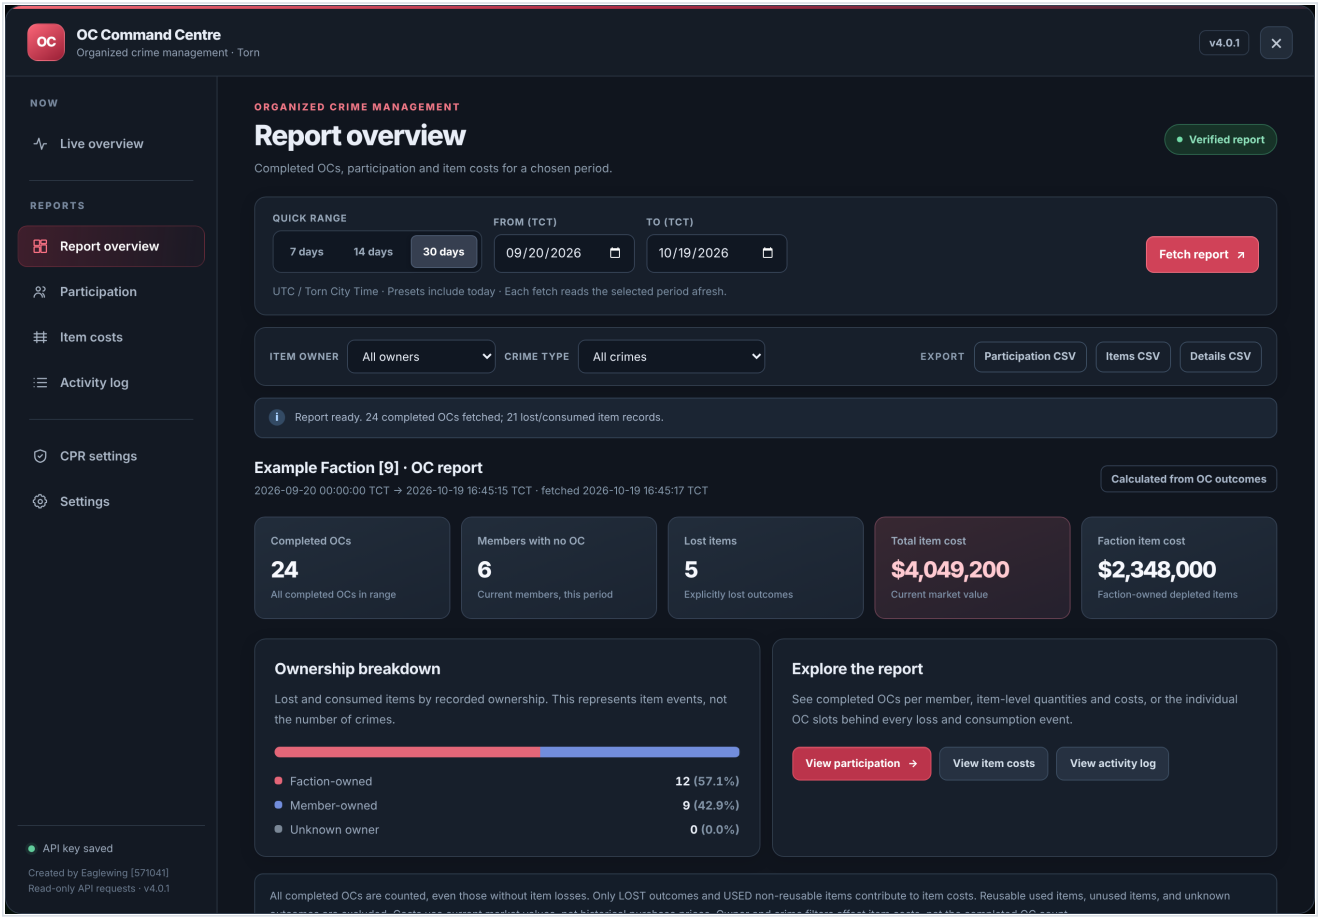

Select a crime to see each slot: member, status, planning progress, pass rate against the requirement, and required item (with "missing" when the member does not have it).

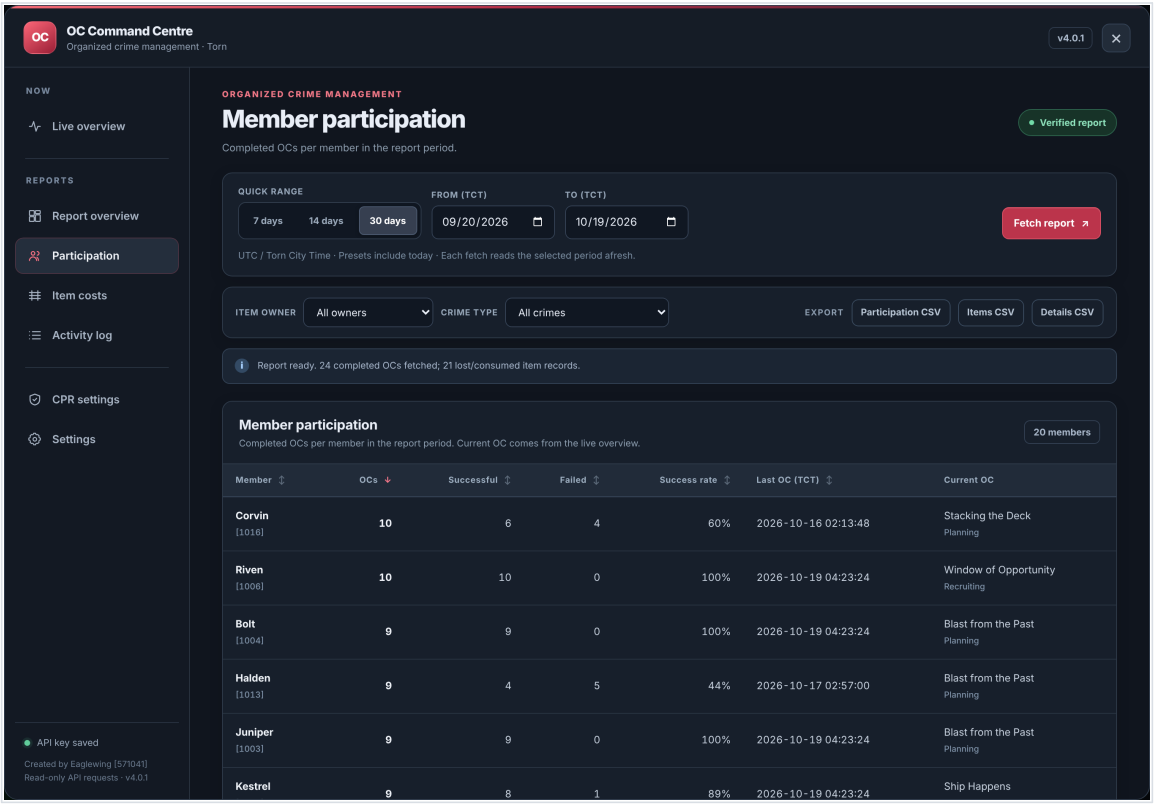

DASHBOARD

8. Reports (leaders)

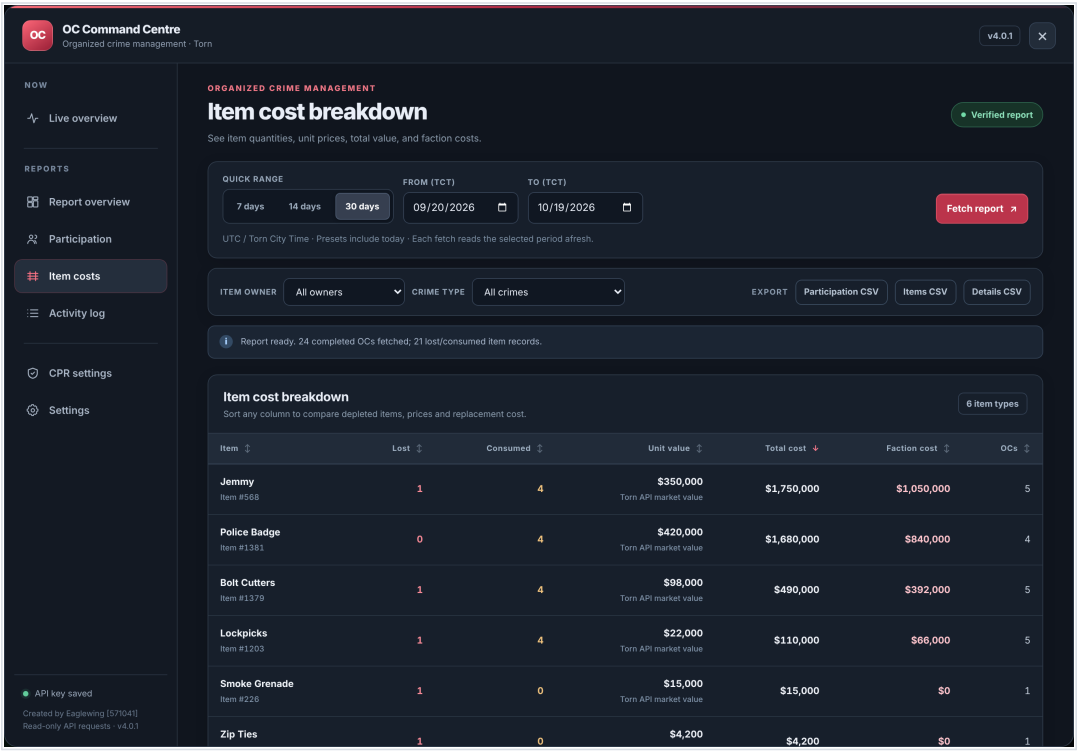

Pick a period (7, 14 or 30 days, or custom dates in Torn City Time) and choose **Fetch report**. The script reads completed crimes for that period from the API; nothing runs until you press the button. The item owner and crime type filters apply to every report view.

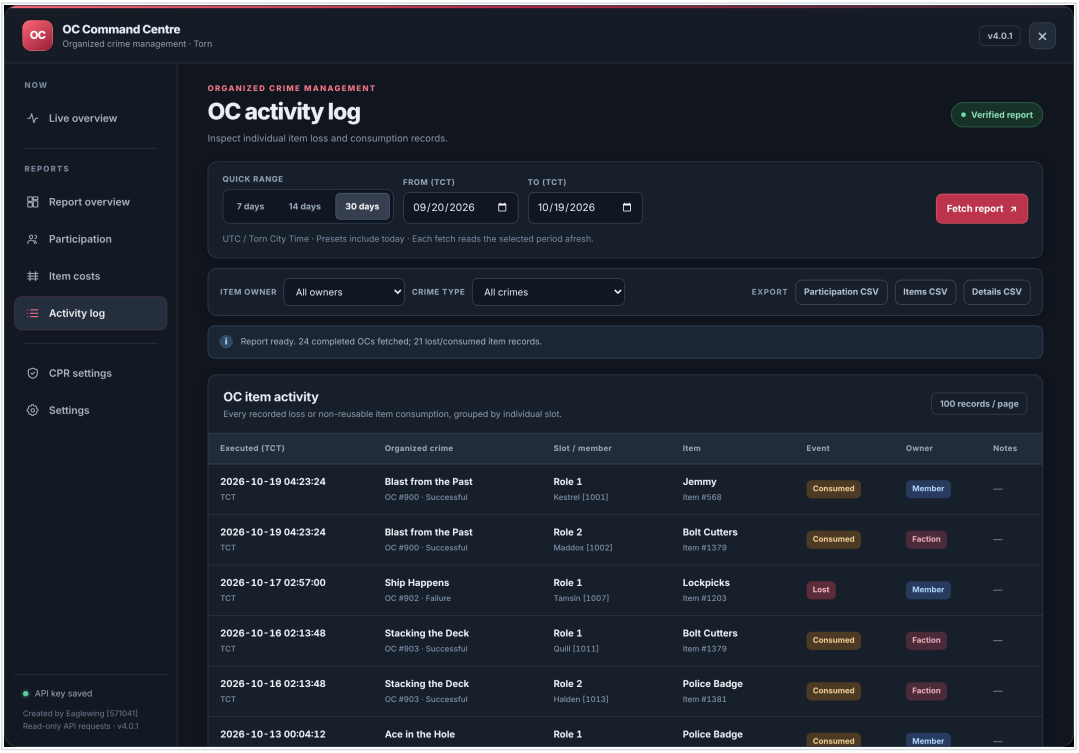

Report overview: completed OCs, members with no OC, lost items, total and faction item cost, ownership breakdown, and links to the detailed views.

Participation: completed and successful OCs per member, success rate, last OC, and current OC.

Item costs: every lost or consumed item with quantities, unit price, total value and faction-owned cost. Prices come from the API, or from TornTools if imported.

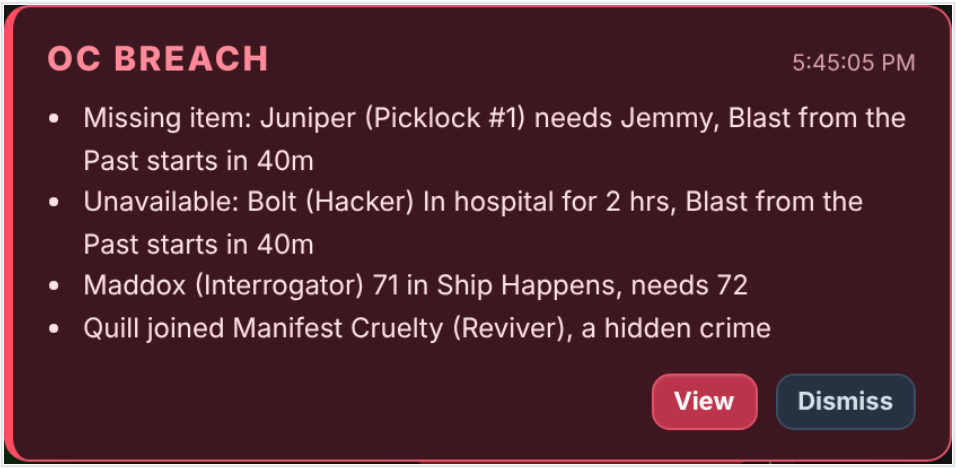

Activity log: every lost or consumed item, by crime, slot and member, 100 records per page.

> Three CSV exports are available once a report is loaded: **Participation CSV**, **Items CSV** and **Details CSV** (slot-level records).

ALERTS

9. OC BREACH alerts (leaders)

Every few minutes (5 by default) one open Torn tab makes a single API call and checks your faction's open OCs. The check and the alert are shared between tabs, so several tabs do not multiply calls or popups. Each problem alerts once.

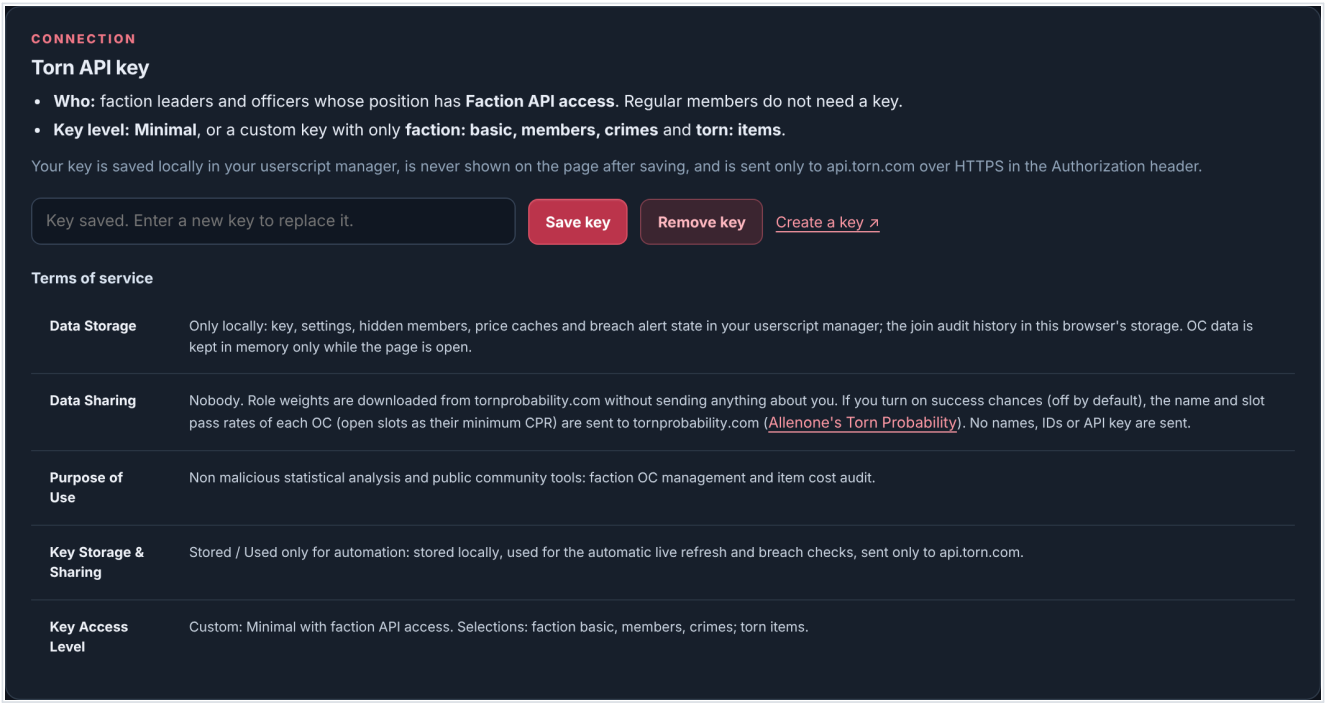

An OC BREACH alert. View opens the live overview; Dismiss hides it.

Alert	Triggered when
Below CPR	A member is below their role's minimum.
Above CPR max	A member is above their role's maximum.
Hidden crime joined	Someone joined an OC marked Hide crime.
Missing item	An OC starting within the hour has a member without the required item (named).
Unavailable	An OC starting within the hour has a member in hospital, jail or travelling.

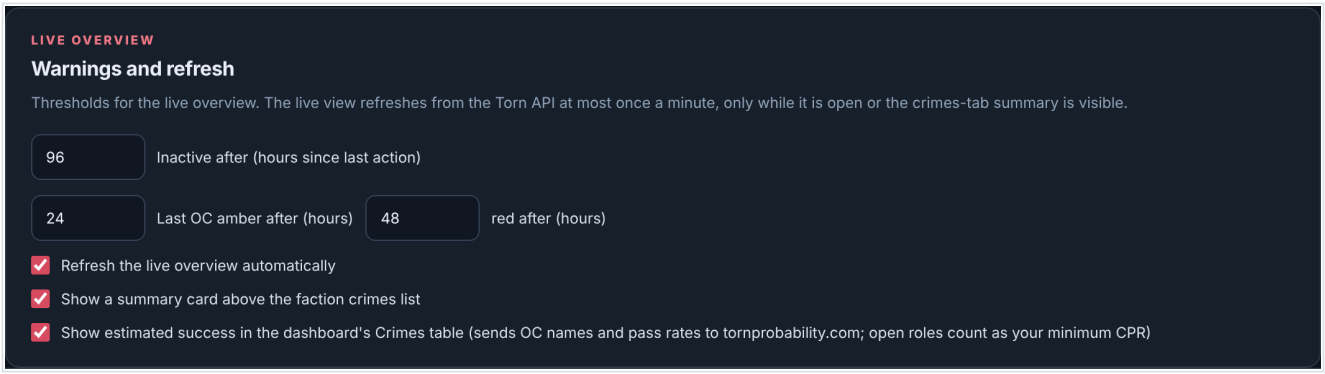

CPR alerts need CPR rules; the item and availability alerts work without them. Each type can be switched off in Settings, and a desktop notification can be added (not available in Torn PDA, where it would block the page).

LEADERS

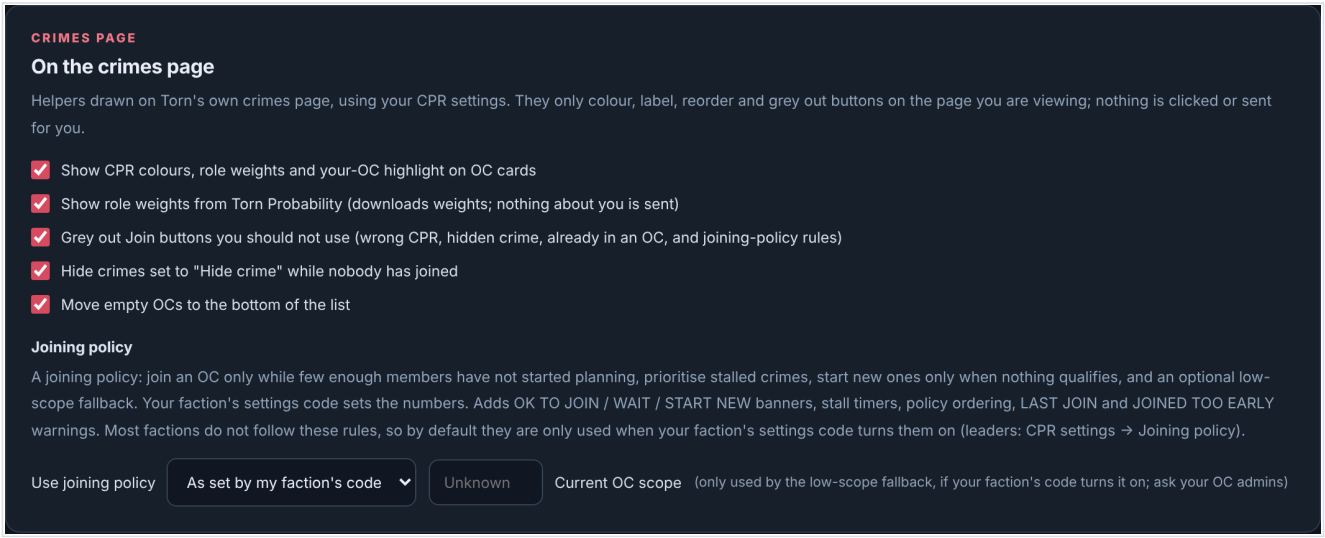

10. Dashboard settings

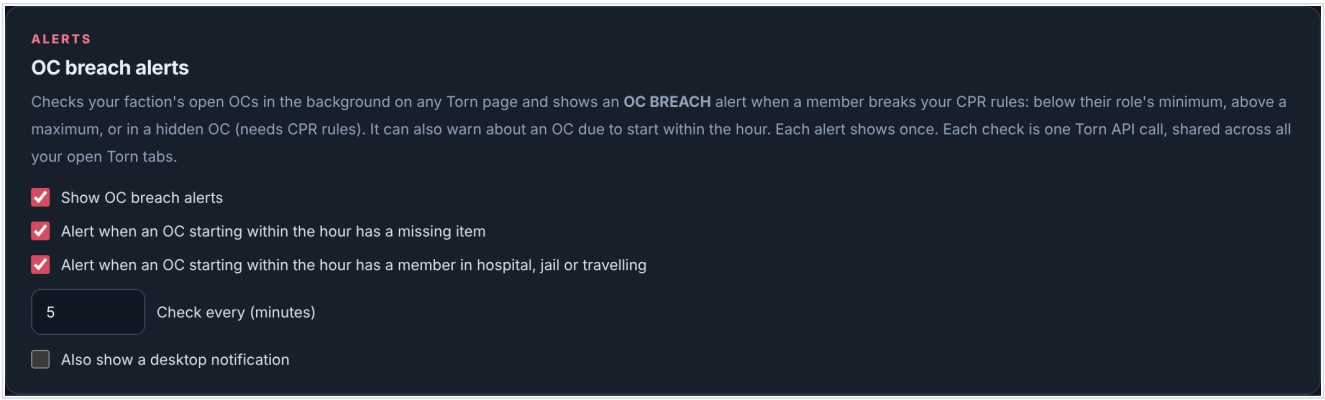

Torn API key: who qualifies, key level, and the Terms of Service.

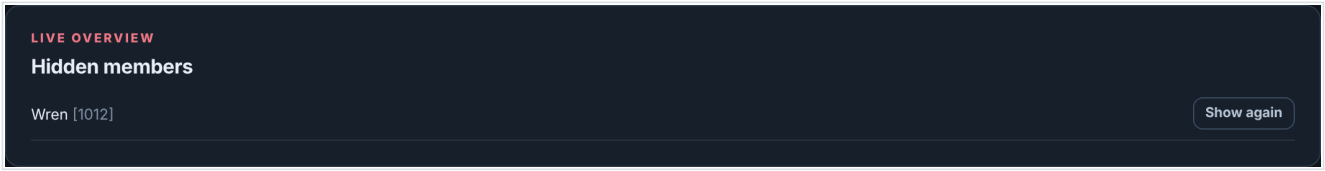

Warnings and refresh: inactivity and last-OC thresholds, auto refresh, the summary card, and Estimated success.

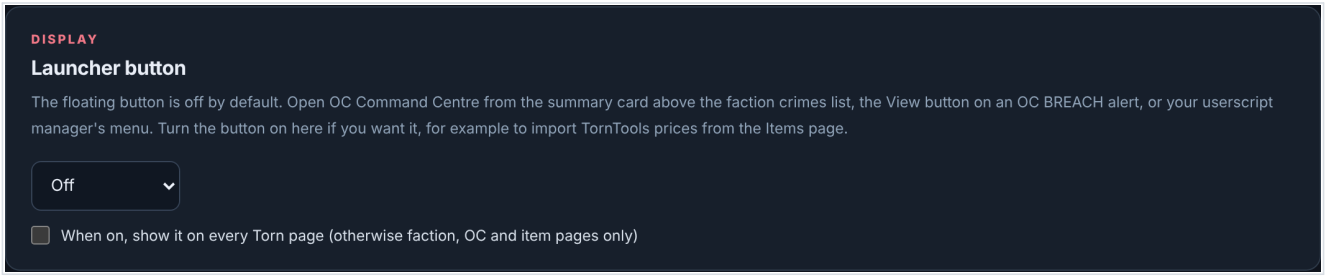

On the crimes page: the same display options members have, plus the joining-policy override and current scope.

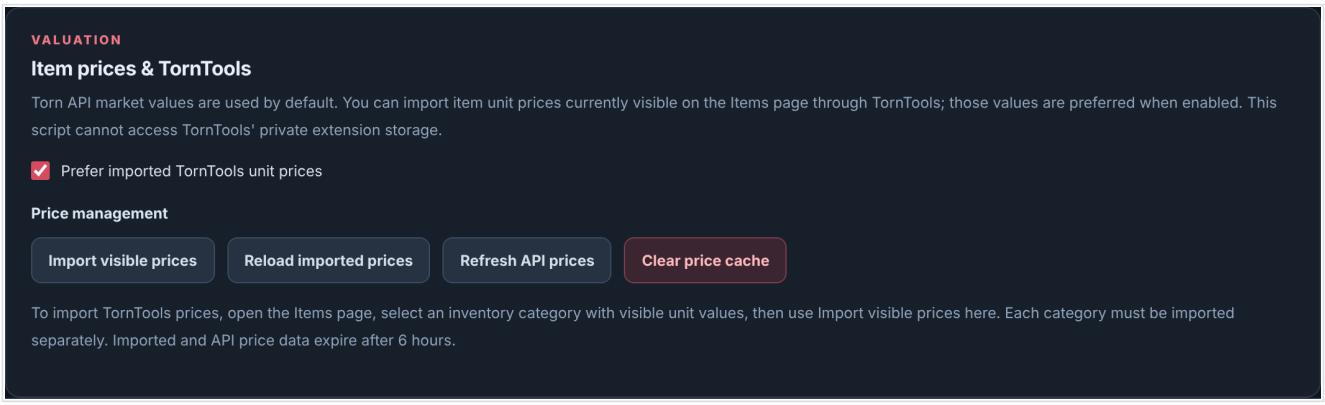

OC breach alerts: on/off, the two extra alert types, interval and desktop notification.

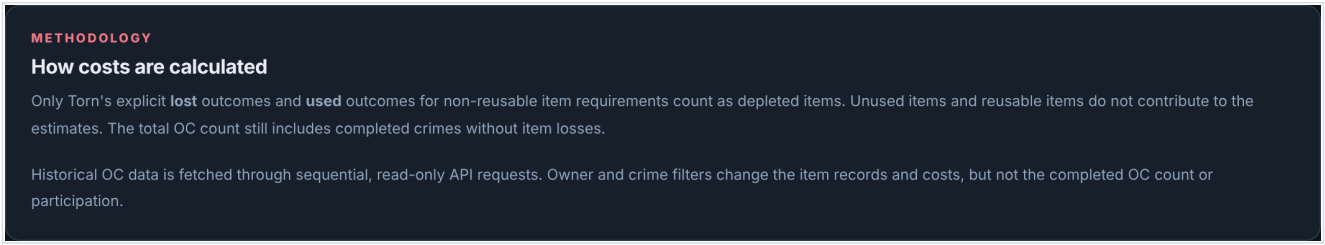

Hidden members, with Show again.

Launcher button: off by default; position, and whether to show it on every Torn page.

Item prices & TornTools: import visible TornTools prices from the items page, refresh API prices or clear the cache.

How item costs are calculated.

Credits.

TECHNICAL

11. Where it runs and Torn PDA

The script loads on Torn pages (`@match https://www.torn.com/*`) so leaders get breach alerts anywhere, but it only does something on these pages:

Page	What happens
Faction crimes tab, organizedcrimes.php	Crimes-page helpers and the summary card; the dashboard for leaders.
Messages (messages.php)	Reads an opened faction newsletter for a settings code.
Items (item.php)	Leaders only: optional TornTools price import from the visible page.
Every page	Leaders only: the OC BREACH check and popup; the launcher if set to show everywhere.

Devices

- **Tampermonkey / Violentmonkey** (desktop browsers): fully supported.
- **Torn PDA**: supported. There is no userscript menu in Torn PDA, so the crimes-page summary card is always shown and its Open button opens the menu. Desktop notifications are switched off there.

Outside services

Service	Used for	What is sent
api.torn.com	Leaders: live data, reports, alerts, item prices	Your API key, in the request header only (never in the address)
tornprobability.com	Role weights (everyone); Estimated success (leaders, optional, off by default)	Weights: nothing. Estimated success: OC names and slot pass rates (open roles as the minimum CPR)

COMPLIANCE

12. Torn rules and Terms of Service

Torn allows scripts that only use the API or the page you are viewing, make no extra non-API requests to Torn, and never automate actions. How OC Command Centre stays within that:

Torn rule	How the script complies
Only use the API or the page you are viewing	Crimes-page features read the page you opened. Newsletter import reads only the faction newsletter you opened yourself, makes no request, and sends nothing anywhere (see section 5). Leader data comes from api.torn.com.
No non-API requests to Torn	None are made. The script never loads or fetches Torn pages.
One action = at most one request	The script never clicks for you. Greyed-out Join buttons stop your click, so they prevent a request rather than make one. Mail opens Torn's compose page in a new tab, as a normal link.
No automated actions	Only API calls run automatically (live refresh, breach checks), which the rules allow. Display changes such as colours, ordering and hiding make no requests.
Flag outside sites	tornprobability.com is the only outside site. It is used for role weights; pass rates are sent only if a leader turns on Estimated success.

Terms of Service

Item	Answer
Data Storage	Only locally. The key, settings, CPR rules, hidden members, price caches and alert state are kept in your userscript manager; the join-tracking history is kept in this browser's storage. Nothing is stored anywhere else.
Data Sharing	Nobody. If a leader turns on Estimated success (off by default), OC names and slot pass rates are sent to tornprobability.com (open slots as the minimum CPR). Role weights are downloaded without sending anything about you.
Purpose of Use	Non-malicious statistical analysis and public community tools: faction OC management and item cost audit.
Key Storage & Sharing	Stored / used only for automation (live refresh and breach checks). Kept locally and sent only to api.torn.com. Members do not need a key.
Key Access Level	Custom: Minimal with Faction API access. Selections: faction basic, members, crimes; torn items.

13. Credits

Created by **Eaglewing [571041]**.

With thanks to Flamer, Allenone, Verboten, Darrelia, Kohnago, pawl, Qfiffle, JohnNash, callmericky and whatdoesthespacebardo, whose earlier work this script builds on. Role weights and estimated success use Allenone's Torn Probability (tornprobability.com).

Screenshots in this guide were taken in a test environment with sample data and fictional member names; the real Torn page looks slightly different.
